1.0 Dataset Overview

The goal of the Global Food Security-support Analysis Data @ 30-m (GFSAD30) is to provide highest resolution, objective cropland datasets to assist and address global food and water security issues of the twenty-first century. The project proposed developing cropland products using time-series Landsat and Sentinel satellite sensor data, machine learning algorithms, and cloud computing. The project is funded by the National Aeronautics and Space Administration (NASA) with supplemental funding from the United States Geological Survey (USGS). The project is led by USGS and carried out in collaboration with NASA AMES, University of New Hampshire (UNH), California State University Monterey Bay (CSUMB), University of Wisconsin (UW), NASA GSFC, and Northern Arizona University (NAU). There were a number of International partners, including The International Crops Research Institute for the Semi-Arid Tropics (ICRISAT).

This user guide provides guidelines of the GFSAD30 cropland extent product for the countries of Europe, Middle-east, Russia and Central Asia (GFSAD30EUCEARUMECE) at nominal 30m in 2015. The Coordinate Reference System (CRS) used for the GFSAD30EUCEARUMECE is a geographic coordinate system (GCS) based on the World Geodetic System 84 (WGS84) reference ellipsoid. The legend is presented in Section 2. Datasets are provided in 10° x 10° raster grid (GeoTIFF) format. The year, resolution, tiling, and file name convention details are provided in section 2.0 and its sub-section of this document.

1.1 Background

Monitoring global croplands (GCs) is imperative for ensuring sustainable water and food security to the people of the world in the twenty-first century. However, the currently available cropland products suffer from major limitations such as: (a) Absence of precise spatial location of the cropped areas; (b) Coarse resolution nature of the map products with significant uncertainties in areas, locations, and detail; (c) Uncertainties in differentiating irrigated areas from rainfed areas; (d) Absence of crop types and cropping intensities; and (e) Absence of a dedicated web data portal for the dissemination of cropland products. Therefore, our project aims to close these gaps through a Global food security support-analysis data @ 30-m (GFSAD30).

Satellite-derived cropland extent map at high spatial resolution are necessary for food and water security analysis. Thereby, GFSAD30EUCEARUMECE cropland extent products were produced at a resolution of 30-m for the countries of Europe, Middle-east, Russia and Central Asia for the nominal year 2015 using Landsat time-series data. These data are part of a global data release; thereby each region will be made publically available. Global cropland extent maps, indicating cropland and non-cropland areas, provides a working baseline data to develop high-level products such as crop watering method (irrigated or rainfed), cropping intensities (e.g., single, double, or continuous cropping), crop type mapping, cropland fallows, as well as assessment of cropland productivity (productivity per unit of land), and crop water productivity (productivity per unit of water or “crop per drop”). Uncertainties associated with cropland extent maps have a cascading effect on all higher-level cropland products.

Cloud-based geo-spatial computing platforms and satellite image inventory offer opportunities for producing precise and accurate maps of cropland extent and area that meet the spatial and
temporal requirements of broad applications. Such maps can be a significant improvement compared to existing products, which tend to be coarser resolution, are often not representative of regions with highly dynamic change, and have a fixed set of cover classes. Cloud-based computing platform such as Google Earth Engine and new earth-observing satellites like Landsat 8 have brought significant improvements to LULC mapping and agriculture monitoring. Specifically, the production of standard static maps of the past will be shifted to dynamic creation maps from massively large volumes of big data, crowd sourcing of training and validation samples, and implementing machine-learning algorithms on the cloud to serve better specific applications.

For a very detailed description of the satellite and reference data, processing scheme, approaches, methods, results, and conclusions please refer to algorithm theoretical basis document (ATBD) of GFSAD30EUCARUMECE.

### 2.0 Dataset Characteristics

Global food security-support analysis data @ 30-m cropland extent for Europe, Middle-east, Russia and Central Asia (GFSAD30EUCARUMECE) datasets and characteristics described below.

#### 2.1 Global Food Security Support Analysis Data (GFSAD) 30-m V001

2.1.4 Filename Convention

GFSAD30EUCEARUMECE_2015_N00W000_001_20162741122.tif
GFSAD30EUCEARUMECE = Product Short name
30 = 30 m Resolution
EUCEARUME = Europe, Central Asia, Russia, Middle East
CE = Crop Extent
2015 = Nominal Year
N10W20 = 10 x 10 degree grid, starting at (N10, W20)
001 = Version
2016 = Processing Year in YYYY

3.0 Dataset Knowledge

The following questions addresses the user information regarding the GFSAD30EUCEARUMECE collection.

3.1 Frequently Asked Questions

**What is the accuracy of the GFSAD30EUCEARUMECE product?**
For the entire study area, the weighted overall accuracy was 93.8% with producer’s accuracy of 86.5% and user’s accuracy of 85.7%. When considering all twelve zones, the overall accuracies ranged between 76-100%, producer’s accuracies ranged between 64-92%, and user’s accuracies ranged between 54-95% These results clearly imply the high level of confidence in differentiating croplands from non-croplands for Europe, Middle-east, Russia and Central Asia.

**What do GFSAD30EUCEARUMECE product contain?**
They provide cropland extent product for the Europe, Middle-east, Russia and Central Asia at nominal 30-m.
What is the definition of the crop extent?

For the entire Global Food Security-Support Analysis Data project at 30-m (GFSAD30) project, cropland extent was defined as: “lands cultivated with plants harvested for food, feed, and fiber, include both seasonal crops (e.g., wheat, rice, corn, soybeans, cotton) and continuous plantations (e.g., coffee, tea, rubber, cocoa, oil palms). Cropland fallows are lands uncultivated during a season or a year but are farmlands and are equipped for cultivation, including plantations (e.g., orchards, vineyards, coffee, tea, rubber)” (Teluguntla et al., 2015). Cropland extent includes all planted crops and fallowed lands. Non-croplands include all other land cover classes other than croplands and cropland fallows.

How to access the dataset?

All the GFSAD30 products will be downloadable through the Land Processes Distributed Active Archive Center (LP DAAC). GFSAD30EUCEARUMECE product divided into 10x10 grids, are among them.

You can also visualize this data @ https://croplands.org by going to “products” drop-down menu there.

Can I access the dataset through Google Earth Engine (GEE)?

No. At this time LP DAAC is the single source. In future, we may release the data through GEE, but this will be decided by Prasad S. Thenkabail, PI of the GFSAD30 project.

4.0 Dataset Access (Applicable Data Tools)

The GFSAD30EUCEARUMECE dataset is available through the LP DAAC Data Pool and NASA Earthdata Search. GFSAD data visualization and information are also made available at our Global Croplands Website: https://croplands.org
